

**Formed Base Diagram**

**The advantages of Base Angle/Trim:**

1. Eliminates the need for a panel notch on your building slab. This will save you labor and forming material on your concrete, saving you money.
2. Covers the point of the screw at the bottom of the walls on the inside of the building.
3. Prevents the cut edge of the wall panels from coming into contact with concrete (which can void any coil coaters warranty on painted sheeting).
4. Covers any irregularities on the edge of your slab to provide a neater finished look.
5. Provides an attractive base trim.
